

CONTROLLING STATIC LEADS TO IMPROVED PRODUCT QUALITY ON WRAPPING MACHINES

Arrowquint are now offering a retrofit static control system for common wrapping lines such as Fuji, B&L and Burgess, where dirt contamination is causing quality problems.

Dirt contamination is a concern for many industries and its root cause is static charges which build up on the film causing airborne dirt and dust particles to cling to the film surface during wrapping.

The Eltex system offered exclusively in the UK/Eire by Arrowquint comprises a combination of high and medium powered ac Eltex discharging bars with a single Eltex power supply. The system is supplied complete with full mounting kit for ease of installation or if preferred an installation service by Arrowquint engineers is also offered.

This highly effective system works on a wide variety of films and can be tailored to fit any other types of wrapping machine. Anyone considering fitting static control equipment to their wrapping lines are invited to contact Arrowquint who offer a free system design service.
