

FINISHING THE DIGITAL REVOLUTION

Electrostatic systems specialists Arrowquint Ltd, say they are getting an increasing number of calls from Digital Printers who are experiencing static problems on the finishing side.

Arrowquint have seen how profitability gains afforded by better print speeds and quality, combined with improved and heavier coated stocks can easily be eroded by disruptions in the finishing process caused by static build up.

To maintain margins on the more complex products with run lengths from a few dozen to a few thousand, finishing needs to be both fast and efficient. Arrowquint say they have proven solutions for counteracting static available immediately for Xeikon, Xerox, Agfa, IBM and MAN Roland digital presses, as well as finishing equipment by Morgana, Stahl, MBO and GBC.

Arrowquint claim that they are at the forefront of developing static solutions for the UK digital printing and finishing market, and warn printers that putting up with finishing problems is an expensive option when compared to the cost of the static solutions they offer
