

DEALING WITH THE DANGER OF STATIC

Electrostatic systems specialists Arrowquint offer comprehensive static safety surveys to process industries concerned about the safety of their plant & personnel.

The survey covers all static related issues, ranging from problems to do with storing or transferring hazardous and volatile substances, to reducing the incidence of static shocks suffered by personnel working in office and factory environments.

As part of the survey Arrowquint consult fully with the client to address their immediate areas of concern, but they also offer detailed recommendations as to how static can be safely managed in the workplace and identify potential risks which the client may not be aware of.

The service includes a written report of the survey findings together with recommendations for remedial action to tackle the static problems that were identified.

In addition, Arrowquint offer a wide range of safety products for protecting plant and personnel who are at risk from static. Their personnel grounding range includes low-cost consumable products such as grounding heel and wrist straps. For plant protection they can design tailor-made ground-monitoring systems and provide a number of bonding devices certified for use in 'EX' areas
